polynucleotide of any one of more than 500 nucleotide sequences fully defined in the specification or its complement. The method of the invention can be used to produced a plant having altered traits such as: enhanced tolerance to abjoic stress; glyphosphate tolerance; hormone sensitivity; disease resistance; sugar sensing; early or late flowering; altered flower structure, change in stem bifurcations, altered branching pattern, reduced apical dominance, reduced trichome density; lack of trichomes; reduced ectopic trichome development; altered stem morphology; increased root growth; increased root hairs; altered stem furphology; increased root growth; increased not hairs; altered seed development; altered cell proliferation or cell differentiation; rapid development; premature sensecence; increased necrosis; increase in seedling or plant prochemistry; increase in root anthocyanins; increase in plant biochemistry; increase in root anthocyanins; increase in plant can alteration in light response or shade avoidance. The transgenic plant, polynucleotides and polypeptides are useful in bioinformatic search methods. This sequence represents a plant transgeric plant actor related polynucleotide.
                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                               0

The present invention relates to the isolation of novel plant

(arabidopsis thaliana) polynucleotide sequences that encode transcription
factors (TRS), and the polypeptide sequences for the TRS. The
polynucleotide sequences are useful in screening for a transcription
factor that modifies a plant trait. Also disclosed is an expression
vector comprising a TP polynucleotide sequence, a host cell comprising
the expression vector, a transgenic plant comprising or ectopically
expressing an isolated TP polynucleotide sequence, a method for screening
for a molecule that modifies a plant trait, a method for screening
transgenic plant, an enthod for identifying a sequence homologous to a TP
polynucleotide or polypeptide sequence, and a method for screening for a
transcription factor that modifies a plant trait. The present sequence
encodes a novel A. Inhaliana TF of the invention. Note: The sequence
encodes a novel A. Inhaliana TF of the printed specification. The
complete sequence data for this patent was obtained in electronic format
directly from the USPTO web site at sequata.uspto.gov.

The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepaticis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-0-methyl modifications, phosphorothicate linkages on at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                  Gaps

of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, corephalitis, myocarditis, meningitis, neurologic infection, hepatitis, neurologic infection, hepatitis, neurologic infection, hepatitis, nelected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' innverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given molecule of the invention
least three of the 5' terminal nucleotides and a 3' end modification of a 3-3' inverted absaic moslety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        invention relates to nucleic acid molecules that modulate replication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WNV; West Nile Virus; antiinflammatory; cytostatic; hepatotropic; virucide; neuroprotective; antibaccerial; replication; panoreatitis; encephalitis; myocarditis; meningitis; infection; hepatitis; liver failure; cancer; cirrhosis; Hammerhead; Inozyme; DNAzyme;

of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatish, encephalitis, myocarditish, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-Cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least three of the S' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic molety. Nucleic acid molecules SEQ ID NO 194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to nucleic acid molecules that modulate replication

of the West Nile Title (MNV). The nucleic acid molecules are useful for treating a condition related to MNV infection e.g. pancreatitis, encephalitis, movarditis, meninglis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-Cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID No 1 to 37080 are claimed, however, SEQ ID No 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to nucleic acid molecules that modulate replication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepaticis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, least ten 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nuclectides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (MNV). The nucleic acid molecules are useful for treating a condition related to MNV infection e.g. pancreaticis.

Liver failure, mepatocallular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least the ribose residues, at least ten 2·O-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nuclectides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed, however, SEQ ID NO 2194-2206 and 17502-17514 are not given molecule of the invention
                                                                                                                                                                                                                                                                                                                                                                        New nucleic acid molecule that modulates replication of West Nile Vin
(WNV), useful for treating a condition related to WNV infection e.g.
pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WNV; West Nile Virus; antiinflammatory; cytostatic; hepatotropic; virucide; neuroprotective; antibacterial; replication; pancreatitis; encephalitis; myocarditis; meningitis; infection; hepatitis; liver fallure; cancer; cirrhosis; Hammerhead; Inozyme; DNAzyme;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         70.8%; Score 17; DB 6; Length 17; 82.4%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WnV infection e.g. pancreatitis, encephalitis, wpocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given molecule of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                             The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of hamerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification.
                                                                                                New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatis, encephalitis, myocarditis, meningitis, neurologic infection, hepatis, invective, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, nozyme, G-cleaver, DNAsyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues that three of the 5 terminal nucleotides and a 3 and modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed, however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, waycarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least the 2'-O-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given molecule of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô

(RIBO-) RIBOZYME PHARM INC. (BLAT/) BLATT L.

(MCSW/) MCSWIGGEN J A.

New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

Claim 23; SEQ ID NO 7450; 495pp; English.

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, meningits, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of

ö
Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid molecule of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis.

Liver failure, myocarditis, meningits, neurologic infection, hepatitis, neurologic infection, hepatitis, molecule is selected from the group of ribozymes consisting of molecule is selected from the group of ribozymes consisting of humarhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprises at least tive ribose residues, at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to nucleic acid molecules that modulate replication

The invention relates to an isolated polymucleotide comprising any one of 18043 cDNA sequences, appearing as ACH12789-ACH50831, whose sequence was determined by the technique of SBH (sequencing by hybridisation). Also included is a purified polypeptide comprising a sequence corresponding to a reading frame of the novel polymucleotide. The nucleic acid sequences are useful in diagnostics as expressed sequence tags (EST) for informations, in assessing blodiversities, or in identifying mutations in foremaics, in assessing blodiversities, or in identifying mutations responsible for genetic disorders and other traits. The nucleotide sequence are also useful as hybridisation production of protein, or in generating antisense DNA or RNA. The purified polypeptide is useful for generating antisense DNA or RNA. The present sequence is one of the 38043 isolated cDNA/EST sequences. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from 18770 at
                                                                                                                                                                                                                                                                                                                                                                                  Human; 88; sequencing by hybridisation; SBH; expressed sequence tag; EST; genome mapping; biodiversity; genetic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polynucleotide sequences obtained from various cDNA libraries, useful as hybridization probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating

This cDNA encodes a murine phospholipase D (PLD) 2 (MPLD2) protein. This can be used in a method for identifying mediators of PLD, which comprises transfecting a coll line with an expression vector comprising nucleic acid sequences encoding a PLD protein and culturing the cell line in culture medium, where the PLD protein is expressed stably. An effective amount of a compound sufficient to cause a detectable loss in the catalytic activity of PLD is added to the culture medium, and the loss in catalytic activity is detected. The PLD proteins are enzymes having phosphatidylcholine specific PLD activity. The PLD polypeptides which are perinuclear membrane associated require PI(4,5)P2 for in vitro activity and is activated by at least 1 G protein. The PLD polypeptides that are plasma membrane associated, activates exposkeletal recognisation pathways, require PI(4,5)P2 for in vitro activity and does not require RecIm cdc42, RhoA, PKC or ARF1 for activation. A PLD mediator can be used to treat autonimume or inflammatory diseases, specifically rheumatoid arthritis, psoriasis and ulcerative colitis. The mediator can also be used in wound healing and for treating cancer and other diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated nucleic acid sequence or fragment coding for a modified KiflC polypeptide, a kinesin-like motor protein. The invention also relates to a method of protecting a cell against Bacillus anthracis infection, comprising administering the nucleic acid to the cell and a method of tracting a mammal affected by anthrax, comprising administering the nucleic acid may be used as hybridisation probes to detect the presence of similar sequences in a sample and therefore detect resistance to infection. They may also be used to produce the KiflC polypeptide which may be used in assays to identify modulators of anthrax infection, a modified susceptible KiflC amino acid sequence or a funcational fragment. This sequence represents a KiflC nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                         Isolated KiflC nucleic acids that confer resistance to Bacillus anthracis Lethal Toxin, useful for detecting and conferring resistance to anthrax

This cDNA encodes a murine phospholipase D (PLD) 2 (mPLD2) protein. This can be used in a method for identifying mediators of PLD, which comprises transfecting a cell line with an expression vector comprising nucleic acid sequences encoding a PLD protein and culturing the cell line in culture medium, where the PLD protein is expressed stably. An effective amount of a compound sufficient to cause a detectable loss in the catalytic activity of PLD is added to the culture medium, and the loss in catalytic activity is detected. The PLD proteins are enzymes having phosphatidylcholine specific PLD activity. The PLD polypeptides which are perinuclear membrane associated require PI(4,5)P2 for in vitro activity and is activated by at least 1 G protein. The PLD polypeptides that are plasma membrane associated, activates cytoskeletal reorganisation pathways, require PI(4,5)P2 for in vitro activity and does not require to pathways, require PI(4,5)P2 for in vitro activity and does not require to treat autoimmune or inflammatory diseases, specifically rheumatoid arthritis, psoriasis and ulcerative collitis. The mediator can also be used the analysis and for treating cancer and other diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

/ Anote="Organ: eye; Vector: pT7T3-Pac (Pharmacia) with a
modified polylinker; Site 1: EcoR 1; Site 2: Not 1;
UT-E-EJO is a subtracted cDNA library constructed
according to Bonaldo, Lennon and Soares, Genome Research,
6:791-806, 1996. First strand cDNA synthesis was primed
with an oligo-dT primer containing a Not I site. Double
stranded cDNA was ligated to an EcoR I adaptor, digested
with Not I, and cloned directionally into pT7T3-Pac
vector. The oligonucleotide used to prime the synthesis of
first-strand cDNA contains a library tag sequence that is
located between the Not I site and the (dT)18 tail. The
sequence tags for this library are: fetal eyes,
AGAATCAAGA; lens, CGATTAGCGA; eye anterior segment,
AATGCGCAT; optic nerve, CCATTAAGTG; retina,
Foveal and Macular, GTCC; RPE and Choroid, ACCTA. This
library was created for the program, Gene Discovery in the
Visual System, supported by National Eye Institute (NEI)."

// Clone the temporal to the temporal from whole 'Williams' seedlings, minus the coryledons, which were propagated on paper towels with distilled water for 5 days, incubated at 40 degrees C for 1 hour. The cotyledons were removed and the remaining tissue was flash frozen in liquid nitrogen. Stratagene's cDNA Synthesis Kit (catalog number 200401) was used to synthesis the CDNA. First-strand synthesis was performed with 5-methyl dCTP, hence the ligated cDNA was hemimethylated. A modification of Stratagene's first-strand Synthesis primer was used. An 'anchor' nucleotide (V=A, C, or G) was added to the 3' end of the primer [GAGAGAGAGAGAGAACATAGTCTCGAG[T]18") to anchor the primer at the 5' end of the poly(A) tract. After second strand synthesis, the CDNA ends were filled in with cloned Ptu DNA, ligated to EcoRI adapters and subsequently phosphorylated. The CDNA was then precipitated and redissolved in sterile, RNasse., DNasse-free water. The Khol site within the first-strand synthesis primer was then restricted by digestion with Xhol from Fromega (400/Lu); all Xhol sites in the cDNA would be protected by their hemimethylated status. The CDNA constructs were size-fractionated with a 500 bp cutoff, using GibcoBRL Life Technologies' CDNA size Fractionation column. The column eluent was then precipitated, redissolved, and ligated into Stratagene's phosphorylated by Stratagene's und Xhol, and phosphorylated by Stratagene's und Xhol, and bhosphorylated by Stratagene's Lond Xhol, and bloseribt Limits appear to contain recombinant plasmids with column size (m=18 and 5, respectively). This ilbrary was constructed by Dr. Paul Kelm and Dr. Virginia Coryell."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A Cobers, L. /clone="Wector: pBluescriptI SK+; Site 1: ECORI; Site 2:
XhoI; This cDNA library was constructed from mRNA isolated
from 2 week old seedlings with the cotyledons removed at
the time of harvest. The seedlings for the cultivar Ogden
were grown in a growth hamber using germination paper.
Complementary DNA was synthesized from mRNA using a primer
consisting of a poly(dT) sequence with a XhoI restriction
site. ECORI adapters were ligated to the blunt-ended cDNA
fragments followed by XhoI digestion. The cDNA fragments
were directionally cloned into the ECORE.XhoI restriction

/note="Vector: pBluescript II SK+; Site I: EcoRI; Site 2:
Xhol; The CDNA library was constructed from mRNA isolated
from 2 week old etiolated whole seedlings of p1468916.
Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dT) sequence with a XhoI restriction site. EcoRI adapters were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The cDNA fragments were directionally cloned into the EcoRI- XhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into DH10B host cells (Gibco BRL). This library was constructed in the laboratory of Dr. Randy Shoemaker at Iowa state university."

/clone_lib="dm-c1059"
/note="Vector: pBluescript II SK+; Site 1: EcoRI; Site 2:
Xhol; The cDNA library was constructed From mRNA isolated
from 2 week old etiolated whole seedlings of PI468916.
Complementary DNA was synthesized from mRNA using a primer
consisting of a poly(dT) sequence with a XhoI restriction
site. EcoRI adapters were ligated to the blunt-ended cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            To (bases 1 to 544)

fragments followed by XhoI digestion. The cDNA fragments were directionally cloned into the EcoRI- XhoI restriction salte of the pBluescript vector. The ligated cDNA fragments were transformed into DH10B host cells (Gibco BRL). This library was constructed in the laboratory of Dr. Randy Shoemaker at lowa state university."

Bhattacharyya from mNA isolated from etholated hypocotyls from the cultivar Williams 82. Tissue was inoculated with Phytophthora soyae race 1 and tissues were harvested 2 and 4 hours following infection. The library is the pool of these two time points. Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dT) sequence with a Xhol restriction site. EcoRI adapters were ligated
                                                                                                                                                                                                                                                                          ö

/foloe="Vector: pBluescript II SK+; Site I: EcoRI; Site_2:
XhoI; The cDNA library was contructed by M. Bhattacharyya
from mRNA isolated from etiolated hypocotyls from the
cultivar Williams 82. Tissue was inoculated with
phytophthora soyae race I and tissues were harvested 2 and
4 hours following infection. The library is the pool of
these two time points. Complementary DNA was synthesized
from mRNA using a primer consisting of a poly(dT) sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      BQ080423 553 bp mRNA linear EST 05-JUL-2004 san33a08.yl Gm-c1084 Glycine max cDNA clone SOYBEAN CLONE ID: OBCARBOXYLASE. [1]; mRNA sequence.

                    to the blunt-ended cDNA fragments followed by Xhor adjacation. The CDNA fragments were directionally cloned into the EcoRI-XhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into bHIOB host cells (Gibco BRI). This library was constructed by M. Bhattacharyya in the laboratory of Dr. Randy Shoemaker at lowa State University."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Anote—"Vector: Bluescript II SK+, Site 1: EcoRI, Site 2: XhoI; The cDNA library was contructed by M. Bhattacharyya from mRNA isolated from etiolated hypocotyls from the cultivar Williams B2. Tissue was inoculated with Phytophthora soyae race 1 and tissues were harvested 2 and 4 hours following infection. The library is the pool of these two time points. Complementary DNA was synthesized
                                                                                                                                                                                                                                                                                         ö

from mRNA using a primer consisting of a poly(dT) sequence with a XhoI restriction site. EcoRI adapters were ligated to the blunt-ended CDNA fragments followed by XhoI digestion. The CDNA fragments were directionally cloned into the EcoRI-XhoI restriction site of the pBluescript vector. The ligated CDNA fragments were transformed into DH10B host cells (Gibco BRL). This library was constructed by M. Bhattacharypa in the laboratory of Dr. Randy Shoemaker at lowa State University."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /clone_lib="Gm-cl065"
/note="Vector: pBluescript II SK+; Site_1: EcoRI; Site_2:
Xho1; The cDNA library was constructed from mRNA isolated
germinating shoots of the cultivar Williams. The seeds
were allowed to germinate for 24 hours prior to being
cold stressed for 2 days at 4C. Complementary DNA was
synthesized from mRNA using a primer consisting of a
poly(dT) sequence with a XhoI restriction site. EcoRI

                                        SOURCE
adapters were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The cDNA fragments were directionally cloned into the Ecost-XhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into DH10B host cells (GibcoBRL). This library was constructed in the laboratory of Dr. Randy
                                                                                                                                                                                                                                                                                                   ö

The seedlings were innoculated with Bradyrhizobium
japonicus, strain USDAllO priot to harvest. Stratagene's
cDNA synthesis Kit (catalog number 200401) was used to
synthesize the CDNA. First-strand synthesis was performed
with 5-methyl dCTP, hence the ligated cDNA was
hemimethylated. A medification of Stratagene's
first-strand synthesis primer was used. An 'anchor'
nucleotide (VaA,C, or G) was added to the 3' end of the
primer (GadAGAGAGAGAGAGAGAACTAGTCTCGAG(T) 18V) to anchor
the primer at the 5' end of the poly(A) tract. After
second-strand synthesis, the CDNA ends were filled in with
cloned btu DNA polymerase, ligated to EocNI adapters and
subsequently phosphorylated. The XhoI site within the
first-strand synthesis primer was then restricted by
digestion with XhoI; all XhoI sites in the CDNA
constructs were size-fractionated with a 500bp cutoff,
using GloboBkL Life Technologies' CDNA Size Fractionation
column. The column eluent was then ligated into
Stratagene's pBluescript II XR Predigested vector
(pBluescript II SK(+) that has been digested with EocNI
and XhoI, and phosporylated by Stratagene). Both the
white and blue colonies appear to contain recombinant
plasmids with cDNA inserts, based on size (n=25). This
library was constructed by Dr. Paul Keim and Dr. Virginia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

| / clone="The library Gm-r1083 is a sequence-driven, reracked set of 4,992 clones selected from cDNA libraries from various tissues and stages of development of soybean. It represents 1117 sequences from the progenitor library Gm-cl09 (from mature roots of 2 month old greenhouse grown 'Williams' soybean plants); 820 sequences from the progenitor library Gm-cl09 (from mature roots of 2 month old greenhouse grown 'Williams'; and 3055 sequences from the progenitor library Gm-cl03 (from 2 of 3 week old whole plants of Williams); and 3055 sequences from the plants of Williams); and 3055 sequences from library Gm-cl028 (from 'Williams); and 3055 sequences from library Gm-cl028 (from 'Spernod' plants whose seedlings were innoculated with Bradyrhizobium japonicum, courtesy of Dr. Gary Stacey). The 5' ESTS of the source clones from the different progenitor libraries was used to select singletons, or a representative of each contig, which were reracked Gm-ri083 library were then sequenced at the 3' end. The contig analysis to select unique genes was performed by the laboratory of Ernest Retzel, Center for Computational Genomics and Bloinformatics, University of Minnesota, http://www.incyte.com, and 3' sequencing by the Keck Center for Comparative and Punctional Genomics, University of Illinois, http://www.lic.uluc.edu/biotech/keck.html. Note: The corresponding 5' EST from each clone in the Gm-ri083 library is listed in the 'OTHER EST' field. The

Clones are derived from the bovine BAC library CHORI-240
(http://www.chori.org/bacpac/bovine240.htm). For BAC library
availability, please contact Pieter de Jong (pdejong@mail.cho.org).
Clones may be purchased from BACPAC Resources
(http://www.chori.org/bacpac/ordering_information.htm). This work
was undertaken as part of the International Bovine BAC Mapping
Consortium (IBBMC) by CSIRO Livestock Industries, Australia and the
British Columbia Genome Sciences Centre, Canada.
British Columbia Genome Sciences Centre, Canada.
Seq primer: SP6
Class: BAC ends.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GM210004B21B10 Gm-r1021 Glycine max cDNA linear EST 04-OCT-2000 mRNA sequence.

Xho1; Library Gm-r1021 is a sequence-driven, reracked_set
of the original library Gm-c1004 which was prepared from
root coDA. The mRNA was isolated from entire roots of 8
day old 'williams' seedlings which were propagated on
paper towels with distilled water. Stratagene's cDNA
Synthesis Kit (catalog #200401) was used to synthesize
the cDNA. The Gm-c1004 library was constructed by Dr.

The library was constructed by Dr. Ralf Sommer DNA Sequencing by:
Mashington University Genome Sequencing Center
Contact Dr. Ralf Sommer (ralf.sommer@tuebingen.mpg.de) for
information about this clone.
Seq primer: -40RP from Gibco
High quality sequence stop: 373.

/note=_Torgan: amnion_normal; Vector: pucl8; Site_1: Smal; Site_2: Smal; A mini-library was made by cloning products derived from ORESTES PCR (U.S. Letters Patent application No. 196,716 - Ludwig Institute for Cancer Research) profiles into the pUC 18 vector. Reverse transcription of tissue mRNA and cDNA amplification were performed under low stringency conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AW097360 465 bp mRNA linear EST 10-MAY-2001 rs42h07.yl Sommer Pristionchus Pristionchus pacificus cDNA 5' similar to WP:C41C4.8 CE05402 TRANSITIONAL ENDOPLASMIC RETICULUM

/note="Vector: pBluescript II KS(+); Site_l: EcoRI;
Site_2: Not1; This normalized library was constructed from
1 million independent clones. CDNA synthesis was initiated
using an oligo(dr) primer, using methylated C in the first
strand synthesis reaction. Following this first strand
reaction, double-stranded cDNA was blunted, ligated to
Not1 adapters, digested with EcoRI, size-selected, and
cloned into the Not1 and EcoRI compatible sites of a
custom modified MCS of the pBluescript (KS+) vector. The
library was normalized in 2 rounds using conditions
adapted from Soares et al., PNAS (1994) 91: 9228-9232 and
Bonaldo et al., Genome Research 6 (1996): 791, except that
used."

/noce="Vector: pBluescript II KS(+); Site_l: EcoRI;
Site_2: Not1; This normalized library was constructed from
I million independent clones. cDNA synthesis was initiated
using an oligo(dT) primer, using methylated C in the first
strand synthesis reaction. Following this first strand
reaction, double-stranded cDNA was blunted, ligated to
Not1 adapters, digested with EcoRI compatible sites of
cloned into the Not1 and EcoRI compatible sites of a
custom modified MCS of the pBluescript (KS+) vector. The
library was normalized in 2 rounds using conditions
adapted from Soares et al., PNAS (1994) 91: 9228-9232 and
Bonaldo et al., Genome Research 6 (1996): 791, except that
a significantly longer reannealing hybridization was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /noce="Organ: Kidney + adrenal; Vector: pBluescript II
KS(+); Site_1: EcoRI; Site_2: Not1; This normalized
library was constructed from 1 million independent clones.
CDNA synthesis was initiated using an oligo(dT) primer,
using methylated C in the first strand synthesis reaction.
Following this first strand reaction, double-stranded cDNA
was blunted, ligated to Not1 adapters, digested with
ECORI, size-selected, and cloned into the Not1 and ECORI
compatible sites of a custom modified MCS of the
pBluescript (KS+) vector. The library was normalized in 2
rounds using conditions adapted from Soares et al., PNAS
(1994) 91: 9228-9232 and Bonaldo et al., Genome Research 6
(1965): 791, except that a significantly longer
reannealing hybridization was used."

/note="Organ: ovary; Vector: pBluescript II KS(+); Site_1:
RCORI; Site_2: Not1; This normalized library was
constructed_from 1 million independent clones. CDNA
synthesis was initiated using an oligo(dT) primer, using
methylated C in the first strand reaction. Gould synthesis reaction.
Following this first strand reaction, double-stranded CDNA
was blunted, ligated to NotI adapters, digested with
ECORI, size-selected, and cloned into the NotI and ECORI
compatible sites of a custom modified MCS of the
pBluescript (KS+) vector. The library was normalized in 2
rounds using conditions adapted from Soares et al., PNAS
(1994) 91: 9228-9212 and Bonaldo et al., Genome Research 6
(1996): 791, except that a significantly longer
reannealing hybridization was used."

//note="organ: kidney + adrenal; Vector: pBluescript II
KS(+); Site_1: EcoRI; Site_2: Not1; This normalized
library was constructed from 1 million independent clones.
cDNA synthesis was initiated using an oligo(dT) primer,
using methylated C in the first strand synthesis reaction.
Following this first strand reaction, double-stranded cDNA
was blunted, ligated to NoI adapters, digested with
EcoRI, size-selected, and cloned into the NoI and EcoRI
compatible sites of a custom modified MCS of the
pBluescript (KS+) vector. The library was normalized in 2
rounds using conditions adapted from Soares et al., PNAS
(1994) 91: 9228-9232 and Bonaldo et al., Genome Research 6
(1996): 791, except that a significantly longer Gallus gallus (Caradata; Craniata; Vertebrata; Euteleostomi; Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Archosauria; Aves; Neognathae; Galliformes; Phasianinae; Gallus.

//note="Organ: ovary; Vector: pBluescript II KS(+); Site_1:
ECGKI; Site_2: Not1; This normalized library was
constructed_from 1 million independent clones. cDNA
synthesis was initiated using an oligo(dT) primer, using
metbylated C in the first strand synthesis reaction.
Following this first strand reaction, double-stranded cDNA
was blunted, ligated to NotI adapters, digested with
ECORI, size-selected, and cloned into the NotI and ECORI
compatible sites of a custom modified MCS of the
pBluescript (KS+) vector. The library was normalized in 2
rounds using conditions adapted from Soares et al., PNAS
(1994) 91: 9228-9232 and Bonaldo et al., Genome Research 6
(1996): 791, except that a significantly longer
reannealing hybridization was used."

diazotroficans]. CDNA was prepared from polyA+ mRNA using SuperScript Plasmid System Kit (Invitrogen). The Gouble-strand cDNAs were fractionated in a sepharose CJ-2B 40cm-columns and fragments sizing between 0.8 and 1.5 Kb were directionally cloned into the vector. Details of each source of RNA and library construction can be obtained at http://sucest.lad.ic.unicamp.br/public"
